New human ATP-binding capreventing and treating

cassette transport cancers,

ransport protein useful for diagnosing, e.g. leukemia, sarcoma, and neuronal

```
The present sequence encodes a human ATP-binding cassette transport protein (ABCtxH). The nucleotide sequence was isolated from a human ovarian tissue cDNA library. Clones from the library were sequenced and used as query sequences against homology databases. ABCtxH encoding polynucleotides were extended using PCR. ABCtxH polynucleotides and polypeptides may be used for the diagnosis, prevention and treatment of conditions or disorders associated with the expression of ABCtxH, e.g. adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma, sarcoma, teratocarcinoma, akathesia, Alzheimer's disease, amnesia, amyotrophic lateral sclerosis, bipolar disorder, catatoria, cerebral neoplasms, dementia, depression, Down's syndrome, tardive dyskinesia, dystonias, epilepsy, Huntington's disease, multiple sclerosis, neurofibromatosis, Parkinson's disease, paranoid psychoses, schizophrenia, and Tourette's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 5; Fig 1; 31pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          e.g. schizophrenia, dementia

```
CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligo-dT primer and an oligonucleotide complementary complementary strand of a polynucleotide which complementary complementary strand of a polynucleotide which comprises one of complementary strand of a polynucleotide which comprises one of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination complementary strand of a polynucleotide which comprises a 5'-end complementary strand of a polynucleotide which comprises a 5'-end complementary to a polynucleotide comprises a 1'-end sequence, where the coligonucleotide comprises a 1'-end sequence, where the combination of the 5'-end sequence/3'-end sequence is selected from those defined in chase therapy and comprises are useful for synthesising polynucleotides, and the specification. The primers are useful for synthesising polynucleotides, comprises are also useful for the detection and/or diagnosis of the abnormality of the protesins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs casily without any specialised methods. AAH03166 to AAH13628 and CAAH3633 to AAH18742 represent human cold sequences; AAB92446 to AAH13632 cold the protestides, all of which are used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2005
```

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent did not form specification, but was obtained in electronic f at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              23-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             27-AUG-1999;
11-JAN-2000;
02-MAY-2000;
                                                  of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence) sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH3633 to AAH18742 represent human cDNA sequences; AAB9246 to AAH13632 The primers allowed by the full-length cDNAs easily without any specialised methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide comprises one of the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2380

the proteins are collectively known as colon cancer antigens. The colon
cancer antigens have cytostatic activity and can be used in gene
therapy and vaccine production. N and P may be used in the prevention,
diagnosis and treatment of diseases associated with inappropriate P
expression. For example, N and P may be used to treat disorders
associated with decreased expression by rectifying mutations or deletions
in patient's genome that affect the activity of P by expressing
inactive proteins or to supplement the patients own production of P.
Additionally, N may be used to produce the colon cancer-associated Ps,
by inserting the nucleic acids into a host cell and culturing the cell
to express the proteins. N and P can be used in the prevention, diagnosis
and treatment of colorectal carcinomas and cancers. AAH37195 to AAH37204
and AAB7789 represent sequences used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventueseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins
                                                                                                                                                                     3982
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (ABB57737-ABB72072).
The sequence data for this patent did not form specification, but was obtained in electronic:
                                                                                                                                                                                                                                                                                                                                                                       3862
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 6534 BP;

                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABLIG511), expressed DNA sequences (ABLIG175) and the encoded proteins

CC CC AAA43426 to AAA45925 represent specifically claimed secreted expressed CC sequence tags (sESTs), isolated from human, mouse, chicken and rat CC tissue sources. The SESTs can have a range of activities depending on CC the tissues they were isolated from. The activities include: CC chemotactic; proliferative; immunomodulatory; haematopoietic; chemotactic; anatipacterial; antifungal; antiviral; antidiabetic; cytostatic; antibacterial; antifungal; antivral; antidiabetic; cytostatic; antiparkinsonian; antipsoriatic; cerebroprotective; CC anticonvolusant; and antidepressant. The sESTs can be used for gene CC anticonvolusant; and antidepressant. The sESTs can be used for gene CC identification and isolation of full-length cDNAs and genomic DNA CC molecules which correspond to the sESTs. Proteins encoded by the sESTs care useful in assays for determining biological activity and raising CC antibodies. They may be useful for treatment of autoimmune disorders (multiple sclerosis, insulin dependent diabetes), allergic conditions CC (anthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, osteoporosis, osteoarthritis, central nervous system disorders (CA disease) rumany barterial fencals, inflammatory disorders (Crohn's disease) rumany and fencal or vival inflammatory disorders. bacterial, fungal or infections, depression and

sequences encoding the enzymes involved in purine biosynthesis are used to genetically modify microorganisms, for the production of riboflavin. Riboflavin, also known as vitamin B2, is essential in humans and animals and is used to treat inflammation of the mouth and throat mucosal layer as well as inflammation in skin disorders. This sequence represents the ADE4 gene which encodes a glutamine PRPP amidotransferase and 2 other open reading frames.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel enzymes involved in purine bin Ashbya gossypii. The enzymes described in the invention in Phosphoribosylpyrophosphate (PPRP) synthetases KPR1 and KPR2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 5369 BP; 1351 A; 1333 C; 1299
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 12; Page 15-22; 48pp;

New isolated nucleic a genes from Drosophila acid a and detection reagent for detecting for elucidating cell signalling 1000 and (0 or more cell-cell

Claim 1; SEQ ID NO 37834; 21pp + Sequence Listing; English

capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences. invention relates to an isolated nucleic acid detection WIPO 18

Sequence 2770 BP; 629 A; 713 C; 725 G; 703 T; 0 other;

                                                                                                                                                                                                The invention relates to human transporters and ion channels (TRICH) polypeptides and their cDNA molecules. The nucleic acid and polypeptide sequences are useful in the diagnosis, treatment, and prevention of complete associated with transport (akinesia, cystic fibrosis, Bell's palsy, amyotrophic lateral sclerosis), neurological (Albheimer's disease, amnesia, dementia); muscle (cardiomyopathy, myocarditis, Duchenne's muscular dystrophy); immunological (AIDS, Addison's disease, allergies, asthma); cell proliferative disorders (cancers, leukaemia, psoriasis); cardiac disease (angina, hypertension, or bradyarrythmia) and in the cassessment of the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of transporters and ion channels. The polynucleotides may be used to detect and quantify gene expression of disease, to generate hybridization probes for mapping naturally occurring genomic sequence, and in drug screening. The present sequence is human compounds on the sequence is human manufactured with a sequence, and in drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .nornton .
